NO. 1825

Amendments to the Specification:

Paragraph at page 3, line 32 to page 4, line 4:

Figures 1A and 1B depict Figure 1-depicts the amino acid sequence alignment between the lecithin:cholesterol acyltransferase corn clone cen3n.pk0141.f2:fis (SEQ ID NO:8), corn clone cep1c.pk001.f7:fis (SEQ ID NO:10), corn clone chpc24.pk0001.c1 (SEQ ID NO:12), and sovbean clone sl2.pk0015.e8:fis (SEQ ID NO:14), with the Arabidopsis thaliana lecithin: cholesterol acyltransferase protein (NCBI General Identifier No. 3935185; SEQ ID NO:15). Conserved sequence elements are shown boxed in black with the amino acid sequence in white. The second boxed sequence (HS*G) contains a conserved serine that is believed to be the active site residue found in all serine lipases. This sequence motif is also conserved in mammalian lecithin; cholesterol acvitransferases (Rogne et al. (1987) Biochem Biophys Res Commun 148:161-169). All of the boxed sequences are largely conserved in the mammalian lecithin:cholesterol acyltransferase sequences.

Paragraph at page 20, line 31 to page 21, line 2:

Figures 1A and 1B present Figure-1 presents an alignment of the amino acid sequences set forth in SEQ ID NOs:8, 10, 12, and 14, and the Arabidopsis thaliana sequence (SEQ ID NO:15). The data in Table 4 represents a calculation of the percent identity of the amino acid sequences set forth in SEQ ID NOs:8, 10, 12, and 14, and the Arabidopsis thaliana sequence (SEQ ID NO:15).
